

Financial Profile

1. Accounting dataset - final recommended baseline

Accounting should answer: **How is this business performing, what is its financial position, and how resilient is that position?**

<u>Data category</u>	<u>Core data</u>	<u>Treatment</u>	<u>Why JusKel needs it</u>
Revenue	Annual turnover/revenue	CORE	Scale and financial performance
	Revenue trend	CORE – derived	Growth/stability/deterioration
Profitability	Operating profit/loss	CORE	Underlying profitability
	EBITDA / EBITDA band	CONDITIONAL	Useful where available/relevant, but shouldn't burden every SME
	Profitability trend	CORE – derived	Direction of financial performance
Cash	Cash/cash equivalents	CORE	Liquidity/resilience
Working capital	Accounts receivable/debtors	CORE	Cash tied up in customers
	Accounts payable/creditors	CORE	Near-term supplier obligations
	Current assets	CORE	Short-term financial resources
	Current liabilities	CORE	Short-term obligations
	Working-capital position	DERIVED	Operational liquidity
Balance sheet	Total assets	CORE	Overall financial position

	Total liabilities	CORE	Overall obligations
	Net assets/equity	CORE – collected or derived	Balance-sheet strength
Borrowing	Outstanding debt/borrowings	CORE	Existing indebtedness
	Finance/debt commitments	CONDITIONAL	Helps contextualise debt burden where available
Financial history	Latest accounting period/date	CORE	Data currency
	Prior comparative period	CORE where available	Enables meaningful trend analysis

Derived Ratios

We would **not ask SMEs for ratios**. JusKel should calculate them. Where sufficient underlying information exists, derive:

Current ratio - current assets ÷ current liabilities

Debt-to-assets / appropriate leverage indicator

Profit margin - profit relative to revenue

Working capital - current assets minus current liabilities

Revenue growth rate

Profitability movement

These are valuable because raw numbers alone don't tell the full story. For example, A £200,000 liability means something very different for a £400,000-turnover SME than a £10 million-turnover SME.

2. Open Banking dataset - final recommended baseline

Open Banking should answer: **What does the SME's actual banking behaviour tell us about liquidity, cash-flow stability and financial resilience?**

<u>Data category</u>	<u>Core data</u>	<u>Treatment</u>	<u>Why JusKel needs it</u>
-----------------------------	-------------------------	-------------------------	-----------------------------------

Liquidity	Current/available balance	CORE	Immediate liquidity
	Average balance	CORE - derived	More representative than point-in-time balance
	Lowest balance	CORE - derived	Identifies liquidity pressure
Cash flow	Total cash inflows	CORE	Actual incoming cash
	Total cash outflows	CORE	Actual outgoing cash
	Net cash flow	CORE - derived	Net liquidity generation
	Cash-flow trend	CORE - derived	Improving/stable/deteriorating cash position
Cash-flow stability	Inflow regularity/volatility	CORE - derived	Predictability/resilience
	Outflow pattern	CORE - derived	Operating cash behaviour
	Material cash-flow volatility	CORE - derived	Potential financial instability
Liquidity stress	Overdraft availability/utilisation	CORE where applicable	Reliance on short-term borrowing
	Returned/failed payments	CORE where reliably available	Potential liquidity stress
	Persistent negative/low-balance periods	DERIVED	Stronger stress signal than a single low balance
Data context	Connected account coverage	CORE metadata	Determines whether JusKel has a sufficiently representative banking view

Observation period **CORE metadata** Essential for interpreting the data

If an SME operates through three principal bank accounts but connects only one, JusKel shouldn't interpret that dataset with the same confidence as a complete banking picture - this ties directly into our existing **Score Confidence** concept.

One addition we would make across both: data provenance and confidence

This is the piece that turns our dataset into an **enterprise-grade JusKel dataset**. Every material financial data point should carry metadata establishing:

Value + source + period + date obtained + evidence/integration status + completeness + confidence

For example:

Revenue: £1.8m

Period: FY2026

Source: Xero

Retrieved: 17 August 2026

Coverage: Full financial year

Status: Integration-derived

versus:

Revenue: £1.8m

Period: FY2026

Source: SME questionnaire

Status: Self-declared

These two values may be identical, but JusKel should **not necessarily have identical confidence in them** - this principle should apply across the platform.

The important separation

We would baseline the distinction in the requirements as:

Accounting data = financial performance and financial position

versus

Open Banking data = actual cash-flow behaviour and liquidity

They complement each other without duplicating one another. For example, accounting may tell JusKel:

Revenue £1.8m

Operating profit £180k

Cash £140k

Receivables £310k

Liabilities £520k

Open Banking may establish:

Average monthly inflows £150k

Average monthly outflows £142k

Positive net cash flow

Relatively stable monthly inflows

Average balance £126k

No material failed-payment pattern

Together, that gives JusKel a much stronger picture than either dataset alone.

What should actually appear in the SME Financial Profile?

We would make the **user-entered assessment considerably smaller** than the underlying data model. For an SME without integrations, we would initially ask only for the genuinely necessary headline information, such as:

Accounting / financial profile

- Annual turnover/revenue
- Profitability / EBITDA band, where applicable
- Current cash/cash-reserve band
- Existing debt/borrowings
- Latest accounts period/date

Then offer:

Connect your accounting software

and/or

Connect your bank account

to strengthen and automate the assessment. Once connected, JusKel can obtain the richer accounting/Open Banking dataset **without making the SME answer another 15-20 questions**.

Note - We would remove several things as **direct SME questions**. For example, we would make SMEs manually provide:

- revenue trend;
- profitability trend;
- net cash flow;
- average bank balance;
- lowest balance;
- income regularity;
- expenditure pattern;
- financial ratios;
- cash-flow volatility.

These should be **derived by JusKel whenever the underlying information is available**. This is an important UX principle: **Collect facts. Derive intelligence**. That is exactly what we intend for our platform like JusKel to be doing.

The final architecture

We would structure the financial dataset internally into **four layers**:

Layer 1 - Raw financial data

Accounting + Open Banking + SME-declared information + uploaded financial evidence.

↓

Layer 2 - Standardised financial metrics

Revenue, profit, cash, debt, assets, liabilities, inflows, outflows, receivables, payables etc.

↓

Layer 3 - Derived financial intelligence

Growth, profitability, liquidity, leverage, working capital, cash-flow stability, financial trends and stress indicators.

↓

Layer 4 - JusKel outputs

Financial Intelligence Score / assessment

Funding Readiness

Recommendations

Funding matching inputs

Score Confidence

Relevant reporting outputs

That is much stronger than simply having an Accounting questionnaire and an Open Banking feed.

Final recommended SME-facing burden

If the SME **doesn't connect anything**, our Financial Profile should ask for only the minimum headline information necessary to establish the baseline, with evidence requested where appropriate.

If they connect **Accounting**, JusKel should automatically obtain and derive the richer accounting dataset.

If they connect **Open Banking**, JusKel should automatically obtain and derive the banking dataset.

If they connect **both**, the platform gets its strongest financial picture and can potentially increase confidence based on completeness and corroboration, **without making the SME complete a longer questionnaire.**

Note: So our key design principle would be: **JusKel shall collect the minimum financial information necessary from the SME and, where authorised integrations or evidence are available, shall use those sources to populate, validate and derive additional financial intelligence without unnecessarily requesting duplicate information from the user.**

And the internal principle: **Accounting tells us how the business has performed and its financial position. Open Banking tells us how cash is actually behaving. JusKel combines the two to understand financial health, resilience and funding readiness, without positioning itself as the lender's credit-underwriting engine.**

Minimum manual Financial Profile

#	<u>Information requested</u>	<u>Recommended SME-facing question</u>	<u>Response format</u>	<u>Why it is necessary</u>
---	------------------------------	--	------------------------	----------------------------

1	Latest annual turnover	What was your business's turnover for your most recently completed financial year?	£ amount or band	Establishes business scale and provides the denominator/context for several financial measures.
2	Latest profitability	Was your business profitable in its most recently completed financial year?	Profit / Break-even / Loss	Gives a simple baseline view of financial performance without forcing SMEs to calculate EBITDA.
3	Profit/loss amount	What was your profit or loss for that financial year?	£ amount / "I don't know"	Allows JusKel to assess profitability rather than relying only on a categorical declaration.
4	Cash position	Approximately how much cash does your business currently hold across its business bank accounts?	£ amount or band	Provides a baseline indication of liquidity and financial resilience.
5	Existing borrowing	Does your business currently have any outstanding loans, overdrafts or other business borrowing?	Yes / No	Establishes whether the SME currently carries financial debt.
6	Outstanding debt	Approximately how much business borrowing is currently outstanding?	£ amount or band; conditional on Yes	Provides necessary context on leverage and existing financial commitments.
7	Current cash-flow position	Over the last 3 months, has your business generally had more money coming in than going out?	More coming in / About the same / More going out / Unsure	Provides a lightweight cash-flow/resilience indicator where Open Banking is unavailable.

8	Accounts currency	When did your most recent financial year end?	Date / Month & Year	Establishes how current the financial information is.
---	-------------------	--	---------------------	---

Maybe we would structure the actual Financial Profile screen like this (let me know your thoughts)

Rather than presenting eight unrelated questions, we divide them into three very short sections:

Financial performance

What was your turnover for your most recently completed financial year?

Was your business profitable in that financial year?

What was your profit or loss?

When did that financial year end?

Cash & borrowing

Approximately how much cash does your business currently hold across its business bank accounts?

Does your business currently have any outstanding loans, overdrafts or other business borrowing?

If Yes: Approximately how much is currently outstanding?

Cash flow

Over the last 3 months, has your business generally had more money coming in than going out?

Then:

Strengthen your financial profile

Connect Accounting | Connect Open Banking | Upload latest accounts

Remember that each question is expected receive a corresponding evidence from the SMEs if they manually fill the questionnaires.

Final Note: We would formally distinguish **“minimum baseline dataset”** from **“target financial dataset.”** The eight items above are the **minimum SME-declared baseline**; but **not** the entire dataset against which JusKel ultimately assesses the business.

The richer target dataset we defined earlier still exists:

Manual baseline + Accounting data + Open Banking data + financial evidence + derived metrics → Financial Intelligence.

This means an SME that provides only the eight baseline items can still proceed, but JusKel knows that its financial intelligence is based on a **less complete/self-declared dataset**. An SME that connects Accounting and Open Banking and/or supplies evidence provides a stronger evidential basis, which can appropriately influence the existing **confidence assessment** without requiring a different questionnaire.

Open Banking Intelligence

Architectural Baseline:

JusKel Banking Intelligence combines customer-authorised Open Banking data with approved Commercial Credit Data Enrichment & Reconciliation to develop a more complete and explainable understanding of an SME's banking, cashflow, payment and credit behaviour. Open Banking remains the primary source of transactional banking intelligence, while commercial credit data supplements and corroborates relevant credit obligations and payment information that may not be observable through connected bank accounts alone. Both sources are reconciled within the Banking Intelligence layer and contribute, according to the governed BIAM™ methodology, to BIS™.

Commercial credit data does not form part of Accounting Intelligence/FIS™, does not create a separate fourth intelligence domain, and must not be represented as universally complete or automatically verified. FIS™ remains independently derived from the Financial Intelligence methodology, with EIS™, FIS™ and BIS™ subsequently integrated under JSFAF™/SFIIM™ to produce SFS™ and support FRI™.

Banking Intelligence

JusKel Banking Intelligence evaluates an SME's observed banking, cashflow, payment, credit and financial-obligation behaviour using customer-authorised Open Banking data together with approved commercial credit-reference data and other authorised banking/credit information sources.

Open Banking provides the primary transactional and cashflow view, while Commercial Credit Data Enrichment & Reconciliation supplements that view with available information about commercial credit facilities, commitments, payment performance and relevant credit indicators that may not be observable from connected bank accounts alone.

These sources are reconciled within the Banking Intelligence layer to create a more complete, evidence-based and explainable assessment of banking and credit behaviour, producing the **Banking Intelligence Score (BIS™)**.

Our revised JusKel financial-data architecture

One important refinement to our BIS methodology

Our existing BIAM currently has seven dimensions:

- Cashflow Analytics
- Payment Behaviour
- Revenue Stability
- Supplier & Creditor Behaviour
- Cash Runway
- Income Consistency
- Banking Resilience.

We would not automatically create an eighth **“Credit Score”** dimension simply because commercial credit data has been added, that risks making us (JusKel) look like a CRA and could distort BIS; instead, bureau information should initially **enrich the relevant existing BIS dimensions**.

For example:

Existing BIS dimension	Open Banking contribution	Commercial credit enrichment
Cashflow Analytics	Strong	Limited/none
Payment Behaviour	Failed payments, recurring obligations	Commercial repayment/payment performance where available
Revenue Stability	Strong	Generally none
Supplier & Creditor Behaviour	Observable creditor payments	Additional permitted creditor/credit information
Cash Runway	Strong	Relevant commitments may contextualise obligations
Income Consistency	Strong	Generally none

Banking Resilience	Balances, overdraft reliance, volatility	Credit exposure/adverse indicators/commitments where methodologically relevant
--------------------	---	---

Note - Commercial credit data enriches BIS; it does not become BIS.

Open Banking retains its specific role

It remains:

Open Banking Intelligence

Purpose: Capture and analyse customer-authorised transactional banking information to understand the SME's actual day-to-day banking behaviour. It can continue to provide indicators such as:

- cash inflows/outflows;
- cashflow volatility;
- revenue/income consistency;
- average balances;
- liquidity/cash buffers;
- overdraft reliance;
- failed/returned payments;
- recurring financial commitments;
- supplier/creditor payment patterns;
- banking resilience; and
- behavioural trends over time.

Those align directly with the existing BIAM assessment dimensions.

Multi-bank limitation

The newly discovered constraint you (Odun) flagged should be explicitly built into the capability:

Open Banking access requires the SME to authorise each relevant banking institution (ASPSP) and select the eligible accounts to be shared through that institution's consent journey. JusKel cannot automatically discover and connect every bank used by an SME through a single universal Open Banking authorisation.

Therefore the JusKel UX provides: **Connect bank** → **authenticate with bank** → **select/share accounts** → **return to JusKel** → **connect another bank** → **confirm banking completeness**

Commercial Credit Data Enrichment & Reconciliation

Purpose: Commercial Credit Data Enrichment & Reconciliation supplements JusKel's Open Banking-derived Banking Intelligence with available commercial credit information obtained from approved commercial credit-reference/data providers.

Its purpose is **not to replace Open Banking**; it addresses information Open Banking alone may not provide or may not completely reveal. Subject to provider coverage, licensing, permitted purpose and applicable consent/lawful-basis requirements, relevant data may include:

- commercial credit facilities;
- outstanding credit commitments;
- loans or other borrowing;
- credit utilisation/exposure information where available;
- repayment/payment performance;
- arrears/default/adverse indicators where available;
- creditor information;
- relevant public-record credit information; and
- other permitted commercial credit attributes.

Reconciliation

Our new journey shouldn't merely be: **Open Banking data + credit report = BIS**; because the valuable JusKel capability is the **reconciliation layer**.
For example:

OPEN BANKING

Customer-authorised accounts

JusKel can then identify:

Corroborated - Information is supported across relevant sources.

Additional credit information identified - The bureau source identifies a relevant commitment/facility not apparent from connected banking data.

Potential discrepancy - Relevant information differs between sources and requires reconciliation/review.

Insufficient coverage - Available sources do not provide enough information to establish completeness.

SME completeness remains essential

We'd therefore introduce **two different completeness concepts within Banking Intelligence**.

A. Banking Connection Completeness

After Open Banking:

Have you connected all relevant bank accounts used by this business?

Options:

Yes, all relevant business accounts are connected

No, connect another bank/account

This is an **SME attestation**. It is not independently verified completeness.

B. Credit & Borrowing Completeness

After commercial credit enrichment/reconciliation:

Review your credit and borrowing information

We've combined available banking and commercial credit information to help build a more complete picture of your business's financial commitments.

We would show the relevant commitments identified.

Then:

Are all current business borrowing and credit commitments represented?

Yes, this is complete

No, add missing commitment

I'm not sure

This closes an important data-quality gap without pretending that we (JusKel) has universal visibility.

Revised end-to-end Banking Intelligence journey

This is the flow that reflects our revised journey - Odun, Austin, and Flourish should take note:

Banking Intelligence

1. Introduce Banking Intelligence: - Explain why JusKel needs banking information and what it will be used for.

↓

2. Connect Business Banking: - SME selects first bank.

↓

3. Bank Authentication & Consent: - Redirect through TrueLayer/bank consent journey.

↓

4. Account Selection: - SME selects eligible business accounts at the bank.

↓

5. Connection Confirmed: - JusKel displays connected institution/accounts.

↓

6. Connect Another Bank

Do you use another bank for this business?

Connect another bank / No

↓

7. Banking Completeness Confirmation: SME confirms whether all relevant business bank accounts have been connected.

NEW ENRICHMENT STAGE

8. Commercial Credit Data: - Explain that JusKel can use approved commercial credit information to supplement the connected banking picture. Required permissions/notices/consent are handled according to the provider and applicable legal basis.

9. Commercial Credit Data Retrieval: - Approved CRA/data provider returns permitted commercial credit information.

10. Banking & Credit Reconciliation: - JusKel compares available credit information against relevant Open Banking-derived information.

11. Review Financial Commitments: - SME sees the consolidated relevant commitments identified. Any discrepancy or missing information is clearly identified.

12. Credit & Borrowing Completeness: - SME confirms completeness or adds missing information.

13. Banking Intelligence Processing: - JusKel analyses:

Open Banking behavioural data

- commercial credit information
- reconciliation outcomes
- SME-confirmed relevant information.

14. BIS™ Calculation: - Generate Banking Intelligence Score and supporting explainability.

15. Integration: - $BIS^{\text{TM}} + FIS^{\text{TM}} + EIS^{\text{TM}} \rightarrow SFS^{\text{TM}}$

For example:

Connect your business banking

Connect the accounts you use for your business so JusKel can build a more complete financial picture.

Step 1 - Select your bank

HSBC / Barclays / Lloyds / NatWest / Starling / Monzo / etc.

Step 2 - Bank authentication

The SME is redirected to the bank and chooses the eligible accounts it wishes to share.

Step 3 - Return automatically to JusKel

JusKel displays:

✓ Barclays Business Current Account

✓ Barclays Business Savings

Do you use another bank for this business?

Connect another bank

Then repeat the authorisation for HSBC, for example.

At the end:

Connected banking

Barclays - 2 accounts ✓

HSBC - 1 account ✓

Are these all of the bank accounts used by your business?

Yes, these are all our business accounts

No, connect another bank

Tech Lead Tasks:

Investigate Experian, Equifax, TransUnion, and potentially other commercial-data providers on **coverage, API availability, licensing, permissible use, reciprocity requirements, cost and whether JusKel's specific use case is eligible.**

Reference Note: Experian's Commercial Acumen combines Open Banking current-account transactions, management-account data and Experian credit information into a consolidated SME view.

Equifax similarly describes its commercial Open Banking product as combining bureau information with company bank-account data.

Experian also has **Commercial CAIS**, a database of roughly 18 million commercial credit accounts, alongside Commercial Credit Data Sharing data.

Financial/ Accounting

Our own FIAM™ framework already points in the right direction: the six financial dimensions are **Profitability, Liquidity, Financial Resilience, Operational Efficiency, Growth & Stability, and Financial Governance**, and the score should reflect capability rather than absolute organisational size or turnover.

We would structure the accounting layer into **five canonical groups**, rather than one long flat list.

1. Income & profitability - CORE

These are indispensable:

- Revenue / turnover
- Cost of sales / COGS
- Gross profit
- Operating expenses
- Operating profit / loss
- Net profit / loss
- Interest / finance expense
- EBITDA, where directly available or reliably derivable
- Depreciation & amortisation, where needed for EBITDA derivation

Why these matter: they let JusKel distinguish growth from profitable growth, margin deterioration from revenue deterioration, and operating weakness from financing burden.

They support metrics such as:

- gross margin
- operating margin
- net margin
- EBITDA margin
- operating expense ratio
- interest burden
- profit trend

Our methodology already identifies gross, operating, net and EBITDA margins and profit growth as relevant FIAM™ indicators.

2. Liquidity & working capital - CORE

Baseline:

- Cash and cash equivalents
- Accounts receivable
- Accounts payable
- Inventory / stock - **conditional by business model**
- Current assets
- Current liabilities

These unlock:

- current ratio
- quick ratio
- working capital
- debtor days
- creditor days
- receivables/payables turnover
- cash-to-current-liabilities
- working-capital trend

This is essential for lenders because two SMEs can have identical profits while having completely different near-term liquidity risks. Our FIAM™ already explicitly expects current ratio, quick ratio, working capital, cash position and receivables/payables turnover.

3. Balance-sheet resilience & leverage - CORE

Baseline:

- Total assets
- Total liabilities
- Net assets / equity
- Outstanding debt / borrowings
- Short-term borrowings, where distinguishable
- Long-term borrowings, where distinguishable

Optional/conditional:

- retained earnings
- tangible fixed assets
- intangible assets

The first five are enough for our MVP scoring. The optional fields become useful later for more sophisticated capital-structure and asset-quality analysis.

These enable:

- debt-to-equity
- liabilities-to-assets
- equity ratio
- leverage trend
- solvency/resilience measures
- asset utilisation

We would absolutely retain net assets/equity. It is one of the strongest general-purpose balance-sheet resilience indicators available across sectors.

4. Cash generation - CORE

Baseline:

- Operating cash flow
- Cash balance
- capital expenditure, **conditional if reliably available**

Potential future:

- free cash flow
- investing cash flow
- financing cash flow

For MVP, **operating cash flow is the important one**. Profit is accounting-based; operating cash flow tells us whether the business is actually generating cash from operations. That distinction is valuable to both SMEs and lenders.

This also creates a useful separation between:

Accounting cash generation → FIS™

versus

Observed banking behaviour → BIS™

5. Period, trend & data-governance metadata - CORE

This is as important as the monetary fields.

Baseline:

- Accounting period start
- Accounting period end
- Latest completed accounting period
- Prior comparative period
- Monthly/quarterly historical observations where supported
- Source accounting platform
- Source entity/company
- Retrieval timestamp
- Last successful sync
- Data freshness status
- Currency
- Accounting basis where available
- Mapping/version identifier
- Data coverage / completeness status

This is what makes our dataset **enterprise grade rather than simply “a list of accounting values.”** Our methodology says FIAM™ places significant emphasis on trends rather than single-period snapshots, including monthly, quarterly and annual performance, seasonality, volatility and improving/deteriorating indicators.

Note - We would not design the canonical schema around:

Revenue = £500k

Prior Revenue = £450k

Rather, we would design it around:

Metric + Period + Value + Source + Freshness + Quality

This scales much better.

What we would make conditional, not universal

Because our system (JusKel), just like enterprise system should understand that not every financial metric is material to every business.

So we would therefore define:

Inventory - conditional for retail, manufacturing, wholesale, hospitality, etc.

EBITDA - conditional where directly available or derivable with sufficient quality.

Customer concentration - useful but only where available without forcing granular invoice ingestion.

Revenue per employee - useful, but source employee count from the company/business-profile domain, not necessarily the accounting platform.

Capital expenditure - useful for asset-intensive sectors, not universally required.

Fixed assets - useful for some resilience and efficiency models, not essential as a universal core MVP field.

JusKel canonical financial dataset I would baseline

<u>Canonical financial field</u>	<u>Status</u>
Revenue / Turnover	Core
Cost of Sales / COGS	Core / conditional by business model
Gross Profit	Core
Operating Expenses	Core
Operating Profit / Loss	Core
Net Profit / Loss	Core
Interest / Finance Expense	Core where available
EBITDA	Conditional / derived
Depreciation & Amortisation	Conditional / derivation support
Cash & Cash Equivalents	Core
Accounts Receivable	Core

Accounts Payable	Core
Inventory	Conditional Core
Current Assets	Core
Current Liabilities	Core
Total Assets	Core
Total Liabilities	Core
Net Assets / Equity	Core
Outstanding Borrowings	Core
Short/Long-Term Debt Split	Should Have
Operating Cash Flow	Core
Capital Expenditure	Conditional
Accounting Period	Core
Historical Period Series	Core architecture
Currency	Core
Source / Provider	Core
Retrieval Timestamp	Core
Freshness Status	Core
Data Quality / Coverage Status	Core

Note - our architecture is strongest when it remains:

Accounting data → FIAM™ → FIS™

Open Banking + permitted Commercial Credit → BIAM™ → BIS™

ESG evidence/data → EIS™

then:

EIS™ + FIS™ + BIS™ → SFS™ / Funding Readiness

Our concept is to never build the JusKel model around: **QuickBooks.PnL.NetIncome**

Instead we build our canonical model around:

net_profit_loss

And then map:

- QuickBooks
- Xero
- Sage
- NetSuite
- Dynamics
- ~~future ERP/accounting systems~~

into that canonical field.

Design Principle: JusKel shall ingest the minimum complete accounting dataset necessary to calculate governed financial intelligence metrics across profitability, liquidity, resilience, efficiency and stability. Raw accounting fields shall not directly determine FIS™. Source fields shall first be standardised into the JusKel canonical financial model, from which governed ratios, trends and indicators are calculated before dimension-level scoring.

Let's structure the five groups as follows:

1. Income & Profitability

Minimum Core

- Revenue / turnover
- Operating profit/loss or net profit/loss

- Reporting period

Enhanced Core

- Gross profit
- Operating expenses
- Operating profit
- Net profit
- Interest expense

Conditional

- EBITDA
- D&A
- Cost of Sales / COGS

Derived

From Revenue + Gross Profit: - **Gross Margin**

From Revenue + Operating Profit: - **Operating Margin**

From Revenue + Net Profit: - **Net Margin**

From Revenue + EBITDA: - **EBITDA Margin**

And using periods: - **Revenue Growth / Profit Trend**

So, no: you don't need COGS **and** Gross Profit to validate profitability if Gross Profit has already been supplied reliably.

In fact, where possible you should avoid unnecessarily demanding both. You can use the second field as a **reconciliation check**, rather than a mandatory source input.

2. Liquidity & Working Capital

Minimum Core

- Cash
- Current assets
- Current liabilities

That already gives:

- Current ratio
- Working capital

- cash position

Enhanced Core

- Accounts receivable
- Accounts payable

These add:

- receivables exposure
- payables exposure
- working-capital efficiency

Conditional

- Inventory

Only for sectors where inventory is material.

Derived

Working Capital: = Current Assets – Current Liabilities

Current Ratio: = Current Assets ÷ Current Liabilities

Quick Ratio, where inventory exists: = (Current Assets – Inventory) ÷ Current Liabilities

3. Balance Sheet Resilience & Leverage

Minimum Core

- Total assets
- Total liabilities
- Net assets/equity

Enhanced Core

- Outstanding borrowings

Enhanced / conditional

- Short-term debt
- Long-term debt
- retained earnings

Derived

Liabilities-to-Assets

Equity Ratio

Debt-to-Equity, where debt is available

The important point here is that **Outstanding Borrowings does not need to be perfectly complete from accounting alone.**

For FIS™, the accounting value reflects: **recorded accounting borrowings**

Then BIAM™ independently examines broader borrowing visibility through:

- Open Banking
- commercial-credit enrichment
- SME completeness confirmation

Those can later be compared at the integrated intelligence layer without contaminating the FIS source boundary.

4. Cash Generation

Minimum Core

Ideally:

- Operating cash flow

If direct cash-flow statement isn't available

We (JusKel) can assess this group more cautiously using available accounting indicators, but we would **not manufacture a cash-flow value from banking transactions and call it FIS operating cash flow.**

That's important.

Open Banking belongs to BIS™, not FIS™.

So if accounting software doesn't give us reliable operating cash flow:

- mark that metric unavailable;
- assess the FIS group with lower coverage;
- use BIS™ to provide the separate behavioural cash-flow perspective.

That is actually one of JusKel's advantages: accounting tells us recorded financial performance; banking tells us observed cash behaviour.

So, we shouldn't blur them just to fill a missing field.

1. Period / Trend / Governance Metadata

This group works slightly differently because much of it isn't a monetary metric.

Minimum Core

- Accounting period
- provider/source
- retrieval timestamp
- currency
- current/latest period

Strongly preferred

- prior comparative period
- multiple historical observations

Derived

- data freshness
- trend availability
- period coverage
- data completeness

This metadata is fundamental because our FIAM explicitly says trend analysis should include monthly, quarterly and annual performance, volatility and seasonality where available.

So the question now is how do we get missing data when QuickBooks/Xero doesn't expose everything?

This is where our **data acquisition hierarchy** becomes important - baseline hierarchy for FIS:

Level 1 - Direct connected accounting data

Preferred source.

Examples:

- QuickBooks
- Xero
- Sage
- FreeAgent

We map provider-specific fields into our canonical financial model.

Level 2 - Derived from connected accounting data

For example:

If a provider does not return gross_margin, JusKel calculates it from: **Gross Profit / Revenue**

If it doesn't return Working Capital: **Current Assets - Current Liabilities**

If it doesn't return EBITDA directly but reliable inputs exist: derive it according to governed methodology and clearly mark: **Derived - JusKel** (the source lineage must remain visible).

Level 3 - Existing JusKel company/profile data

Some required context should be reused rather than collected again.

For example:

- number of employees
- sector
- company age

Then FIS can calculate: **Revenue per Employee** (without needing accounting software to expose payroll headcount).

Level 4 - Financial-document evidence

Where API fields are missing, allow structured extraction from approved accounting evidence, for example:

- annual accounts
- management accounts
- P&L
- balance sheet
- cash-flow statement

AI can extract the value, but our existing governance remains:

AI extraction → SME review/confirmation → canonical financial field (this does **not** mean AI calculates FIS - it just assists data capture).

Level 5 - SME-provided structured financial input

If neither the connection nor the document provides a required field, allow the SME to enter it.

But label its provenance correctly: **SME-provided / self-declared** (it can have a different confidence status than directly retrieved accounting information).
